On the track of Austro
part III. basic vocabulary comparison

La Vaughn H. Hayes

1. Introduction

1.1. Background. In Parts I and II of this series (Hayes 1992, 1997b), it was ob-
erved that the primary reason the Austro hypothesis has not been confirmed and
Austro generally accepted as an established language phylum composed of the AA
and AN language families is because the published supportive lexical evidence has
never been considered probatively adequate to the task.¹ This evidence comprises
perhaps in toto some 5–600 comparisons, beginning with Wilhelm Schmidt's pre-
sentation of 215 sets of putative lexical correspondences between Austroasiatic and
Austronesian when he first proposed the Austro hypothesis in 1906. Subsequent
contributors (Pou and Jenner 1975, Benedict 1976; Shorto 1976, Diffloth 1977,
1990, 1994, Hayes 1992, 1997a, 1997b) have each adduced lesser numbers of com-
parisons, with the total of 267 presented by Hayes now surpassing Schmidt's initial
contribution. This study will introduce 127 new comparanda and bring the Hayes
total up to 394.

Although Schmidt's lexical evidence has apparently never been subjected to a
rigorous and comprehensive examination in print, it seems fair to say that its prin-
cipal weak points are lack of basic core vocabulary comparisons and inclusion of a
type of vocabulary easily suspect as being borrowed. Gérard F. Diffloth has essayed
a limited review of Schmidt's data, as well as that presented by Saveros Pou, Philip
N. Jenner, and Harry L. Shorto, and concluded that “The lexical agreement between
Austroasiatic and Austronesian, such as we see it at the moment, is not impressive,
whichever lexical class one chooses to look at; but it is undoubtably there (1994:
312).”

Since the lexical agreement is there, as Diffloth so sagely counsels us, one
might think that it remains only to find and present a respectable amount of this
evasive lexical material in order to end once and for all the debate about the credi-
bility and validity of the Austro hypothesis. As all investigators, including the writ-
er, have discovered, the matter is not quite so simple as that.

¹. Abbreviations used here are AA (Austroasiatic), AN (Austronesian), AT (Austro-Tai), CF (composition
form), CN (Central Nicobar), E (East, Eastern), FO (Formosan), KY (Khmü’ Yuan), MK (Mon-Khmer), MM
(Middle Mon), MP (Malayo-Polynesian), MUK (Mường Khêên), N (North, Northern), NK (Nyah Kur), OM
(Old Mon), P (Proto-), PC (Proto-Chamic), PCEMP (Proto-Central Eastern Malayo-Polynesian), PM (Proto-
Mon), PMN (Proto-Monong), PNB (Proto-North Bahmaric), POC (Proto-Oceanic), PSB (Proto-South Bahmar-
ic), PVM (Proto-Viet-Muong), PW (Proto-Waic), V (vowel), W (West, Western), VN (Vietnamese).
Three reasons for this difficulty can be identified. First, credible AA/AN comparisons are exceptionally hard to find, partly because published AA lexical data have always been in limited supply and partly due to obscuration and concealment of lexical, phonological, and semantic linkages by diachronic change. This fact was pointed out in Austric I and II, and some changes of the obscuring/concealing sort were described in Austric II. Second, many potential AA cognates are so phonologically similar to their proposed AN correspondents that borrowing by Austroasiatic from Austronesian is suspected—curiously, the reverse is never proposed—and whether or not this is actually the case, detractors are able to use the borrowing issue as grounds to discount such comparisons and thereby minimize and/or discredit the available evidence. Third, previous lexical data presentations have arguably not been as comprehensive and systematic as needed to demonstrate convincingly the dimension of lexical correspondence and regularity of phonological, morphological and semantic correspondence necessary to justify a genetic linguistic relationship.

In this part of the Austric series, an attempt will be made to overcome some of the difficulties described above through the means of a presentation of lexical correspondence in the basic vocabulary area. It is hoped that this paper will go far towards conclusively ending the 90-year long debate over the existence of credible lexical evidence for Austric and clear the way to the phylum's general acceptance.

1.2. Purpose and objectives. The purpose of this paper is to demonstrate that a certain degree of lexical correspondence does exist between Austroasiatic and Austronesian in the basic vocabulary area of the lexicon and that this correspondence is of such magnitude and nature that it is more likely indicative of a genetic, rather than a contact relationship. To that end, basic vocabulary reconstructions from Proto-Malayo-Polynesian, one of the two primary AN subgroups—Formosan being the other, will be presented and used as a reference point for discovery of potential lexical correspondents in Austroasiatic.

2. Preliminaries

2.1. The AA and AN phonological systems. The proto-phonemes used in the lexical reconstructions presented in the basic vocabulary comparison in Section 3 are displayed in the following subsections. Since the representations of the PAN and PMP sound systems are identical, Proto-Austronesian is used as a label for both in the display and discussion.

2.1.1. The consonant systems. A major difference between the two systems displayed in Table 1 is the reconstruction of a retroflex series, */T, D, S, Z, N/ for Austronesian. */T, D/ are not accepted by all Austronesianists, and */C/, a
voiceless retroflex affricate not included in the table, is even more questionable. Other differences are presence in Austroasiatic of */G, x, l, R, [N]/, which have merged with other phonemes or become lost in Austronesian according to Paul K. Benedict (cf. 1975:155). Note that PAA */R/ is a postvelar spirant and not identical to the PAN velar spirant */R/, the AA equivalent of which is represented by */γ/.

2.1.2. The vowel systems. The PAN vowel system comprises four phonemes: */i, ə, a, u/* (/ə/ is customarily represented by */e/). The PAA vowel system is provisionally reconstructed with six sounds: */i, e, ə, a, u, o/; but it is already becoming clear that additional vowel phonemes and diphthongs will probably have to be reconstructed eventually. Until this revision is possible, PAA vowel reconstructions must be regarded as very tentative work in progress.

2.2. Basic vocabulary

2.2.1 Basic vocabulary defined. The concept of a basic vocabulary comprising the most commonly used words of a language is probably as old as the study of language itself. It is apparently only during the past five decades that the concept has taken on a specialized time-linked meaning. This development can be traced back to Morris Swadesh who introduced in 1949 a lexicostatistical method he called glottochronology (cf. Lehman 1992:175), which was based on the assumption that the most common words of a language—its basic core vocabulary—are retained over time at a precise rate. In this context, Jacques B.M. Guy (1995:63) defines basic vocabulary as follows:

"Basic vocabulary", as understood in glottochronological theory, is then merely "stable vocabulary", ideally the set of universally elicitable lexical items such that each member of the set has the same high probability of surviving unreplaced through a unit period of time as any other member. Even if such a set were not likely to be empty, and if there were a way of computing the retention rates of individual items without carrying out a preliminary classification of the languages involved, its membership could only be determined after examining
the whole vocabularies of all languages. Relaxing the requirements for inclusion into the set (using items elicitable in most communalects of a given language group, with approximately the same individual retention rates) would still require the preliminary collection of very large vocabularies from many languages and dialects, making glottochronology based on lexicostatistical data an impractical proposition.

In recent years, glottochronology has been generally discredited because Guy and other scholars have demonstrated that no such precise rate of diachronic retention can be shown to exist for all natural languages or even for all members of a given natural language family. The concept of a basic vocabulary which is resistant to diachronic replacement and thus more stable over time than the rest of the lexicon remains nevertheless useful to historical linguists. This is so because such vocabulary would tend to retain evidence of the lexical, phonological, and morphological characteristics of the ancestral language longer and more faithfully than other lexical categories and thus provide a greater degree of evidential and probatory proof of the ancestral language's nature and any genetic relationship existing between the languages being compared.

2.2.2. Basic vocabulary determination

2.2.2.1. General. As Guy points out, determining the content of a universal basic vocabulary would require ideally classification of the vocabulary of all the world's languages or as a minimum classification of the vocabulary of all the languages in the specific language family under study. Such classification is not yet possible on a world-wide scale, nor is it feasible in many language families, to include Austroasiatic and Austronesian, because the lexicons of all member languages have not yet been recorded in sufficient detail or at all. Those facts have not hindered linguists from compiling basic vocabulary lists.

Swadesh constructed a number of basic vocabulary lists containing varying numbers of common words; his 200-word list is given in Lehman 1992:180f. Other scholars have also prepared such lists. Some very short ones (6–20 words) may have universal applicability, but it appears that as a rule of thumb, the more words placed on a list, the less appropriate it becomes for an increasing number of languages. Some words must be invariably added or subtracted in order to reflect more accurately the common word situation in specific language groupings.

2.2.2.2. AA basic vocabulary. Linguists of the Summer Institute of Linguistics have designed two lists for usage with the MK languages, both modifications of the Swadesh 200-word list, one comprising 207 words (Thomas and Headley 1970: 411–16), the other 281 (Miller 1994:72–81). The modifications are based on lexical compilations from a subset of the MK languages; they are not the result of a general lexical classification of Mon-Khmer, an as yet impossible project due to lack of the necessary lexical materials on all MK languages. To the writer's knowledge, no basic vocabulary list has ever been prepared for the Munda languages.
As a result of this situation, it is not possible to present in this study a word list with any bonafide claim to representing the AA basic vocabulary, either contemporarily or at any earlier historical stage of this language family. Constructing such a list, an ad hoc effort at best, would doubtlessly require more time and effort than expended on this entire presentation.

2.2.2.3. AN basic vocabulary. In general, AN lexical and historical studies are far advanced in comparison to those in the AA field. Although an all-language-inclusive lexical classification is no more possible than it is in Austroasiatic, AN lexical compilations of all sorts, from word lists to dictionaries, are generally more numerous and more comprehensive than in Austroasiatic. On the historical side, reconstruction of high-level proto-languages, to include Proto-Austronesian, is fait accompli in the AN field whereas in Austroasiatic, no comparable reconstructions exist. Accordingly, Austronesianists are able to compile lists of basic vocabulary reconstructions which can claim (with a degree of accuracy unknown to the writer) to reflect the common words of earlier language stages in the AN hierarchy.

No such list exists for the PAN level, but Robert Blust (1993:280–4) has prepared a list of PMP basic vocabulary reconstructions, which will serve the purposes of this study. This is a 201-word AN-specific modification of the Swadesh 200-word list; however, Blust cites more than one proto-form for certain English glosses, affixed derivatives for two, and a homophone for two others, which raises the list's word total to 240. In this presentation, the derivatives have been removed and the homophones combined, reducing the total to 237 (see Section 3).³

In the referenced source, reconstructions are also simultaneously listed for the primary descendants of Proto-Malayo-Polynesian, i.e. the CEMP, Central MP, and Oceanic proto-languages. These lists are not reproduced here; however, where possible AA correspondents exist for proto-forms found on these lists, but not on the PMP list, these comparisons are cited in Section 3 as additional items.

2.2.3. Basic vocabulary comparison. Optimally, reconstructed basic vocabularies for the PAA and PAN levels should be compared in order to determine what lexical, phonological, and morphological correspondence exists between these proto-languages and how this correspondence affects the question of their genetic relatedness. As noted in Subsections 2.2.2.2 and 3, however, no PAA or PAN basic vocabulary exists, and it is not possible to assemble one or both within any reasonable amount of time due to lack of supporting lexical materials. Hence, a different and less optimal approach must be taken here.

Accordingly, the PMP basic vocabulary reconstructions presented in Section 3 are used as a referential base. Potential lexical correspondents to those proto-forms are adduced from Austroasiatic, if such correspondents can be found, together with their provisionally reconstructed PAA antecedents. The rationale underlying

³ The excised derivatives are PMP */b-in-ahi, ba-b-in-ahi/'female/woman' and */h-in-ipi, h-um-ipi/'dream'. The combined homophones are PMP */qasawa/'husband' and */qasawa/'wife'.
this methodological approach is simple and not believed to be theoretically inconsistent.

Since basic core vocabulary is resistant, but not invulnerable to diachronic replacement, it follows that some basic vocabulary items will be retained and some will disappear, but disappearance from the basic vocabulary category need not mean that an item has been lost from the lexicon; it may have simply undergone semantic shift and still be there. As a consequence, some subset of the non-basic vocabulary in some languages will correspond to a subset of the basic vocabulary in other languages in a set of genetically related languages. More importantly, the former will retain the same characteristics found in the latter which are useful to historical comparatists as noted in Subsection 2.2.1, and recovery of such lexical correspondences should provide comparisons of historical value equal or comparable to comparisons found only in the basic vocabulary.

2.3. Methodology

2.3.1. Some basic issues. Historically-comparative studies of languages such as the Austroasiatic and Austronesian, the genetic relatedness of which has not been verified, are generally known as megalo- or long-range comparisons, and critics of such comparisons routinely point to an acclaimed lack of rigor in the methodology applied in such endeavors. Although sometimes overdone, the criticism is doubtlessly appropriate in one respect. In conventional methodology, the bottom-up approach is used, whereby comparison is begun at the lowest level of the taxonomic hierarchy and gradually stepped up to the top-level. At each level, proto-languages are reconstructed and used as the basis for the next-step comparison. Due to the general lack of historical studies and reconstructed proto-languages mentioned in Subsection 1.1, a top-down approach must be used in the Austric comparison, whereby data from the lowest level AA languages and such mid-level reconstructions as are available are compared and the AA proto-language reconstructed on that basis. The PAA and PAN reconstructions are then compared in order to gain insight to the nature of Proto-Austric.

Although the top-down approach does not seem to be theoretically unsound, it should probably be judged as methodologically flawed because some quantity of the diachronic developments which occurred between the top and bottom levels probably cannot be recovered and this inability introduces an indeterminate degree of inaccuracy and unreliability into the results of the comparison. Whether or not the comparatist is willing to accept this risk, is of course a subjective decision. In the writer's case, it is felt that the long-term advantages accruable from taking this approach to AA and Austric historical studies will outweigh the disadvantages of some limited inaccuracy and purist disapproval.

2.3.2. Proof of genetic correspondence. The general purpose of the writer's series of papers on Austric is presentation of linguistic evidence supportive of Schmidt's Austric hypothesis, and its objective is affirming that Austric is a valid linguistic construct. As stated in Austric I (Hayes 1992:148), multiple agreement in the basic core vocabulary is one type of evidence considered proof of the genetic relationship
which must exist between Austroasiatic and Austronesian if the Austric hypothesis is to be verified. But a simple listing of lexical comparisons seemingly evidencing such agreement is not sufficient to accomplishing our objective; these comparisons must also exhibit genetic 1) phonological and 2) morphological correspondence, defined in Austric I as 1) recurrent correspondence of phonemes as to their position in phonemic strings expressing morphemes with correspondent semantic contents and 2) phonemic correspondence of any part of phonemic strings expressing word forms, but only of such parts having the same position with respect to the other parts of the words compared.

The criterion by which demonstration of such correspondence is considered rigorous is apparently that no exceptions are allowed. That is, all correspondences in the lexical comparanda presented must be recurrent or regular and the semantic contents of the comparanda must be identical. Unfortunately, that criterion cannot be met across the board at this stage of the AA/AN comparison. In truth, it is rarely, if ever met, in any historical comparison; some unexplainable irregularities almost always exist. In conventional comparisons, that fact can be conveniently swept under the rug because the irregularities are few, the regularities in majority; in long-range comparisons, the irregularities are often numerous and unavoidable and thus must be openly displayed and faced by the comparatist.

In the PAA reconstructions presented in Section 3, most phonemic correspondences are in fact regular, at least where the consonants are concerned. The vowels are a different matter, as indicated in Subsection 2.1.2. Many phonemic correspondences which would otherwise appear to be irregular are explainable in terms of environmental phonetic or morphophonemic conditioning. For example, AA */b/* correlates regularly to AN */b/, but the /rn/ */b/ correspondence in the Brou {ramul}/PMP */Rabun/ 'cloud' comparison in Subsection 3.2 appears to be irregular. However, it becomes clear in the analysis that */b/ must have alternated with */mb/ in the distant past and the cluster coalesced as */m/ in some cases, as in Brou {ramul}, but remained */mb/ in others, as in Mundari {rimbil} 'cloud', or was simplified to */b/, as in PMP */Rabun/, cf. AN */Ra(m)bun/. This alternation apparently resulted from usage of an ancient affix */N/ which could be optionally inserted in the word (cf. Hayes 1992:167ff.). Dialectal variation probably explains why this affix accreted to */b/ and the cluster coalesced in selective fashion. Such explanations are not unknown in methodologically conventional presentations.

Even in conventional comparisons, the requirement of identical semantic content is not always rigorously applied, but the degree of laxity permitted is usually not large. The same approach is used here. At least one cognate form expressing identical content is used where available in the lexical comparisons. When none is available, the comparanda listed must express a meaning which is minimally divergent from or logically translatable into the meaning of the PMP form. In Subsection 3.8, for example, the meaning of VN {uróc} 'to desire, wish for, hope for' is correlated to that of PMP */ma-pia/ 'good' under the assumption that what one desires or wishes for is usually something good. This assumption is less risky than it might seem because the corresponding AN proto-form */pi[y]a[h]/ means 'desire, desiderative marker', PMP */ma-pia/ being a stative derivative.
In recognition of the fact that the justification for a number of the correlations seen in Section 3 may not be clear, liberal usage of explanatory footnotes is made.

2.3.3. Identification of loanwords. In Subsection 1.1, the problem of AN loanwords in AA comparative data was briefly addressed. It is a methodological necessity that all such words be identified and eliminated from the basic vocabulary comparison in order that an accurate evaluation of the AA/AN lexical correspondence can be made. This task is relatively easy when the AA and AN forms are phonologically and semantically very divergent or exactly identical, as in the case of Semelai and Malay {bulan} ‘moon’, cf. PMP */bulan/ ‘moon’ in Subsection 3.2. It becomes more difficult when the AA form is minimally divergent, phonologically and/or semantically, from its PMP correspondent, as in the case of Katu {tam}, PMP */ma-qitem/ ‘black’ in Subsection 3.8. Here, criteria for loanword identification must be developed, and thus far, three primary ones have been established.

1) Presence of a Munda cognate is grounds for inclusion of a comparison. The rationale is that there is no known reason to suspect that Munda was ever in contact with Austronesian; hence, it cannot possess any AN loanwords. In the case of the ‘black’ comparison, Sora {stum} ‘groping in the dark’ appears to be a reflex of AA */itəm/ > */cəm/. Katu {tam} may still be an AN loanword, although there is little reason to think so in view of the fact that Chamic possesses no reflexes of PMP */ma-qitem/, but even if it is, that is not grounds for rejection of the entire comparison due to the Munda cognate’s presence.

2) Presence of a distinctive phonological correspondence is also grounds for inclusion. A correspondence of this type is /l/ : */n/, as in the comparison Bahnar {lai} ‘mound of dirt’, PMP */qenay/ ‘sand’ in Subsection 3.2. The Bahnar form cannot be borrowed from AN because Austric */l-/ > AA */l/, AN */n/ and a later change of this */n/ back to */l/ is unknown in any AN language with which Bahnar could ever have been in contact.

3) Presence of a distinctive phonological development is further grounds for inclusion. This is a development which makes it clear that the diachronic evolution of the AA lexical form has been so different from that of its AN correspondent that the AA form could not possibly have been borrowed from Austronesian, as in the case of Khmu’ {?om}, PMP */danum/ ‘water’ in Subsection 3.2. Khmu’ */om/ continues the Austric root */[?]om/, while PMP */danum/ reflects an affixed derivative, */zall[?]om/, of the same root. Katu {dolom} ‘gulp’ is apparently a reflex of the same Austric derivative, though it may have been created at a later date. Comparisons in which Austroasiatic has retained a reflex of the bare Austric root and Austronesian a reflex indicating affixation of the same root or its compounding with another root are fairly common. Much less often, it is Austronesian which has retained the bare root and Austroasiatic the morphologically more complex lexical form.
3. Basic vocabulary comparison

3.1. General. The following 12 subsections are titled according to semantic category: nature, flora, fauna, anatomy, kinship, cultural artifacts, descriptives, verbs, pronouns, numerals, prepositions, and miscellaneous. The numbers given after the subsection title, such as (29/22), denote before the slash the number of PMP forms in the category and after it the number of PMP/AA comparisons presented.

In the PAA column, a single asterisk preceding a proto-form identifies it as valid for Proto-Austroasiatic, two asterisks identify it as valid for Proto-Munda or Proto-Mon-Khmer only. In the AN column, PC reconstructions are cited after the PMP forms when available. Most of these come from Lee 1966:179–220, with the remainder provisionally reconstructed by the writer on the basis of Lee’s findings.

4. Lexical data cited in Pinnow 1959 are referenced by his indcial numbers, V denoting those found in the section on vowels, K those in the section on consonants.
5. Cf. AN */Ra(m)bun/ ‘atmospheric obscurity/turbulence, atmospheric cloudiness’, AT */γ[a](m)bon/ ‘rain, drizzle (fine rain), mist, snow, clouds, dusk, dark, sky’, Proto-Kam-Sui */bun/ ‘sky’, Proto-Mjuevic */ʔbuŋ/ ‘cloud’.
6. Limited to Vietic and Katuic. The original meaning of the root was perhaps ‘sun’, whence ‘day’ via ‘light of the sun’ or the like. Such Baharic forms as {srô} [srô?] in Jeh {srô ay} ‘dawn’ may also belong to this etymology. Also cf. AN */ha(n)daw, qa(n)jaw/ ‘day, sun’, AT */(q)a(n)draw/ ‘sun, star, sky’, Proto-Kam-Sui */ʔdraʉ/,. Proto-Thai */ʔd[u]l,ɾ]auʔ/ ‘star’.
7. This comparison is based on the assumption that the PMP form reflects an infixed derivative of the Austroic root, *taneq/ or possibly */taleq/ in view of Bunun /dalaq/ ‘earth’.
8. The root may have been */suɣ/ (or */uy/, cf. Koho *ôs) ‘fire’), with */sa(m)puy/ an infixed derivative. Note that */s/> /o/ in Sora and */s/> */h/> /o/ in PMP, cf. Atayalic */sapuy/ ‘fire’ in Formosan. The Chamic glottal stop is secondary, appearing before all vowels. Also cf. Kharia (*sului) ‘get hot’, which may confirm the AA initial's identity as */s/.
Pearic puy ‘tinder’, Katu mpoih ‘fire’ *[sa](m)puy(s)
Sora (V384) umôd-ôn ‘fog, mist’, Khmu’ (hm)puut ‘clouds, fog’ *(m)put9 PMP *kabut ‘fog/mist’
Khmu’ riy’h ‘forest without underbrush’, Pacoh arujh rûng trung ‘wilderness’, Sengoi jeres ‘the jungle’ **[a]lac(i)10 PMP *halas ‘forest’
Chrau tanlô ‘lake, pond’ **[ləw]11 PMP *danaw, PC *danâu ‘lake’
Santali bilit, Nicobar pola-leet, Pearic la:t, la:c ‘lightning’ *(bi)[l]at(i) PMP *kilat ‘lightning’
Katu kamlaaq, Khasi leiieh [leiie?] ‘lightning’ **(bi)[l]aq12 PMP *qusilaq ‘lightning’
Katu baraal ‘pale’, Bateg Deg boye: (*r > y) ‘white’, Bahnar monhal ‘very bright light or sunshine’ **b(i,a)[l]al13 PMP *bulan ‘moon’, PC *bilân ‘month, moon’
None14

Brou cuyal, Old Mon kyâl, Khmer khyâl ‘wind’ **ka[n]jâl15 PMP *berâńi/beRjin ‘night’
PMP *quzan, PC *hujân ‘rain’

9. Limited to Sora and Khmu’, and the Sora development is obscure. Suspected Aslian reflexes, such as Sengoi {kabus} ‘mist, fog, mirror Malay {kabus} ‘dark, misty’, cf. also Malay {kabut} ‘dark’, and are probably loanwords. Cf. also AT */[ka](m)but/ ‘mist, cloudy’ and Proto-Thai */[b]ut/ ‘cloudy’.
10. Also cf. Mundari {aru:} ‘plants, vegetables’, Pareng {aru:} ‘a tree, wood’, and Sora {aru:jaŋ-an} ‘forest’, which may reflect an underlying Austroic root */[a]a/, whence */[a]at(i), [a]ats(i)/, or a truncation of the cited AA proto-form.
11. The Chrau word appears to be an isolate in Austroasiatic, but in view of the lateral, it is difficult to assert that it is borrowed from Austronesian. VN {æo} ‘pond’ is possibly reflective of an Austroic root */[ʔ][a,aʔ]/, but suspect as a loan, cf. Ancient Chinese */ʔau/ ‘bay, bank’, Thai {ʔaw} ‘gulf, river bend’.
12. Limited to Katu and Khasi, and the Khasi phonology is obscure, but Chamic has apparently borrowed this word from Mon-Khmer, cf. NRoglai {chaca-laq liaq} ‘lightning’ with a glottal stop (orthographic q) instead of h, the regular Chamic reflex of PMP */q/. PM */kha/ ‘lightning strike, struck by lightning’ may reflect a variant, */praq/, in which the cluster coalesced as */t/.
13. This comparison is based on the assumed semantic shift of ‘(pale) white’ to ‘moon light’ to ‘moon’. The Austroic root may be reflected in Jehai (Sem. Jarum, C184) {ã} ‘cloud’ and Kintaq Bong (Sem. Buk. Max., C184) {al} ‘sky’. Khasi {blar-blar} and {blir-blir} ‘pale’ appear to reflect metathesis of variants */baral/ and */biral/. Also cf. AT */(q)(m)bual / ‘white, moon, silver’, Proto-Thai */[b]i[ŋ]ien/ ‘month, moon’. Malay {bulan} ‘moon’ and reflexes of PC */bilân/ have been borrowed by a number of MK languages in Vietnam and Malaysia.
14. AA forms such as PNB */mâŋ/ ‘night’ suggest */m[b]aŋ/, a possible correspondent of AN */bën[ih]/ ‘night’; however, this comparison cannot hold up to scrutiny in face of the unevideanced */b/ in Austroasiatic and the post-Dempwolff revisions of the AN proto-form to */beRjniʔ/.
15. Cf. AT */(q)[u(n)]dzal/, EFO */qudzal/ ‘rain’. The Austroic root may have been */dzal/, reflexes of which some AA dialects apparently retain, cf. Pearic {ksâl}, Chrau {chiul} ‘wind’. Other dialects reflect the developmental sequence */nz/ > */nj/ > */iy/ > */y/, whereby the ancient cluster became a glottalized or

PMP *qasu ‘smoke’
PMP *biuqen, PC *pitü? ‘star’

imploded cluster which dissimilated and reduced to the palatal glide.

16. The South Munda glosses indicate */b[u]cut/, perhaps an old compound or suffixed derivate, cf. also
Sora {basud-ông} ‘salt’. Other suspected AA members of this etymology indicate */(m)puc, puluq/, etc., possibly
suggesting an Austroic root */pu/, whence */(m)puts/ > AA */qa(m)puc(i)/ and AN/PMP */timus/.

17. Katu apparently reflects development of one variant, */si[γ]aq/ > */saraq/ > {rieq} [riw?], which could
be an AN loan, but not from Chamic, while Mal reflects another variant, */su[γ]ak/ > */sukuk/ > */suak/ >
{suak}, where the velar is another suffix or perhaps a reflex of */c/ from earlier palatalized */q/, cf. also
*/su[γ]aq/ > */saraq/ > High Katu {harowq} [haruwa?] ‘tasteless’, i.e. ‘unsalted’.

18. Bahnaric and Katuic have borrowed this word from Chamic, cf. Katu {tachiq}, Jeh {dak sī} ‘ocean’.

19. AA */(p)b-len(i)/ ‘sky’ was cited in Hayes 1997b as corresponding to AT */[i]ndu[la]nit[i]/, whence AN
and PMP */lanjít/ ‘sky’ per Benedict; however, the AA form may correspond more correctly to AT
*/b[a]lnuj/ ‘sky, rain, thunder’, which has reflexes in Formosan, cf. WRukai *ta-bulu[naj]/ ‘sky’, but not
PMP. Sora (V364) {range} (CF {riŋj}) ‘air’ possibly corresponds to AN/PMP */lanjít/, but it is an isolate and
the phonology is obscure. The AA term for ‘sky’ may have been */[i]ndu[jan]/, cf. Khmu {lawaj}, Chrau
{lwarn}, and Sora {ru-c-ŋ} ‘sky’, which correspond to AN */hawaj/ ‘air, atmosphere, sky’. This reconstruc-
tion suggests an Austroic root */[i]nu/ which may be incorporated in both AN */lanjít/ and */hawaj/.

20. Limited to South Munda and Stieng.

21. The *fic, fi/ clusters evolved to /j, ŋ/ under imprecisely known circumstances, cf. also Sengoi
{nyu} ‘give off smoke’, Khmer {ja’k} ‘suck in, smoke (tobacco)’, Alak {yok hieit} ‘smoke tobacco’. Also
note Proto-Philippines */qasu/ ‘smoke’.

22. The MK reflexes could be borrowed from Chamic on phonological grounds, but most of them mean
‘sunlight’ or ‘sunshine’, suggesting that they are not recent loans from Chamic.
Khasi máw, PW *smo?, PM *tmoo? ‘stone’
Kharia g'aray, Khmer phgar, PM *gər-gər ‘thunder’
None

Khasi um, Khmu’ ?om ‘water’, *[?]om
Mundari (K542) um ‘wash the body, bathe’
None

3.3. Flora (9/8)

Katu (High) asoŋ ‘leaf’
Sengoi caak [ca:ʔ] ‘branch’
Sora pun-pun ‘form spikes, ears or heads’, VN bông ‘flower’, Pacoh apong ‘ear of corn, tassel of banana’
Kensiu kəʔɔ, Sabum kəməʔ ‘fruit’, Stieng moq ‘type of small fruit’
Sora jiːŋ-ən ‘weeds’, Chrau canji ‘grass, weeds’, Stieng conji ‘overgrown with weeds’
None

**zaqa**
*(m)puŋ*
**(m)b[oʔa]q**
**(n)je**

PMP *daqan ‘branch’, PC *dhān ‘bough’
PMP *buŋa, PC *buŋa ‘flower’
PMP *buaq ‘fruit’, PC *boh ‘egg, fruit, ball’
PMP *baliji ‘grass’
PMP *udu ‘grass’

23. This comparison is based on the assumption that either metathesis, as in Austric */tabuq/ > AN */batuq/, or infixation, as in */batuq/ > */batamuq/ > AA */tamuq/, has occurred. Austric or AA */tambuq/ > AA */tamuq/ is also possible.

24. Well represented in Austroasiatic, but more often in forms meaning ‘drum’ than ‘thunder’, cf. also AT */(ŋ)guruq, ga-raq ‘rumble, growl, thunder, snore’.

25. Reflexes are found pan-Austroasiatic, but the meaning ‘water’ is retained only in Khasi and Khmu’; elsewhere, semantic shift to a variety of things and activities related to ‘water’ has occurred. Chamic has no reflexes of PMP */danum/, which probably reflects Austric */zail[ʔ]om/, but cf. PC */minum/ and AN */hinum/ ‘drink’ which are based on the same root.

26. Poorly evidenced and somewhat speculative. The Austric root may have been */qa/, whence */z(i)a(n)qa(n)/. cf. Mon {saka} /haka/ ‘toothiick, twig or slip of wood for cleaning teeth’, High Katu {ajruh} ‘snag’, Korwa (V274) {sinj}, Khasi {diŋ} ‘tree’, Bahnar {dong} ‘branch’, the diverse phonological developments apparently reflecting divergent stress shift patterns.

27. Katu {bangura} ‘flower, tree’ is the only AA form evidencing the second syllable seen in AN */buŋa[ʔ,h]/, and it is probably borrowed from Chamic. If the comparison is valid, then the second syllable must be assumed to be either a suffixal construction or the reflex of another root in compound with */pun/.

28. Limited to Sora and South Bahnaric.
Danaw kätən⁴, kätən⁴, Kotua tuan, Bahnar don ‘ear’
Mundari (V366) ur ‘bark of a tree’, Palaung hu:r(-ς), Nha Heun sruat ‘skin’
Mundari (V366) harta ‘bark of the tree’, Sora ə-kar ‘nail(s) (of finger or toe)’, Jah Hut jaŋkar ‘root’
**da[q]un²⁹ PMP *dahun ‘leaf’
*(s)uy(at)³⁰ PMP *uRat ‘root’, PC *ʔurăt ‘vein, tendon, nerve’
*(n)qay³¹ PMP *wakaR ‘root’
**k(i,a)hi(uq)³² PMP *kahiw ‘wood’, PC *kaiəu ‘tree’

3.4. Fauna (16/10)

Black Riang luk² ak¹ ‘crow’,
Katul plok ‘pigeon’, Mone gacem k(a)lok ‘owl’
Bondususur(ə), PW *so?, VN cho ‘dog’
None
None
Juang susuter(ə), Pacoh tireal tıɾəl, PVM *t(ə)lur? ‘egg’
None
Santali (V64) kako, PW *ka?, PM *kaa? ‘fish’
**luk PMP *manuk ‘bird’, PC *manū? ‘chicken’
*cu(q) PMP *asu, PC *ʔasu ‘dog’
*teʃəR³³ PMP *qali-wati ‘earthworm’
PMP *kalati ‘earthworm’
PMP *qateluR/qitetuR ‘egg’
PMP *bulu, PC *balə ‘feather’
PMP *hikan, PC *ʔikan ‘fish’

29. Limited to Palaungic and Bahnaric. Note that */d/ > /t/ in Danaw and Kotua. The MK forms are suspected remnants of an old compound meaning ‘leaf of the ear’, cf. Malay (daun telinga) (‘leaf’ + ‘ear’ =) ‘outer ear’. In view of their locations (Bahnaric in the central highlands of southern Vietnam, Palaungic in northern Burma), no reason exists to suspect borrowing from Malay.

30. This comparison is based on the assumption that PMP *uRat/ is a reflex of AN */huRat/ ‘sinew, tendon, vein’. The initial sibilant was apparently a prefix, for */s-/ is normally retained as /s-/ in Mundari (*/s-/ > Palaung /b/-). The original meaning of the root is unclear, but may have been ‘skin’, whence ‘bark (= skin of tree)’, ‘sinew (= strip of skin)’, and the like.

31. Jah Hut {jaŋkar} ‘root’ could be borrowed from Malayan or Aceh, but this seems unlikely in view of Diffloth’s PM */cŋko(o)/ (‘Nyah Kur) exterior envelope of vegetals, outer skin of coconut, tree bark, (Mon) bark of tree, fibrous outer husk of coconuts’.

32. The phonological development is obscure, but the Austroic root was perhaps */hi/ or */he/ suffixed with */u/ and/or */q/, cf. also Palaung (Panku) {her²} ‘tree, wood’ and PMN */chi/ ‘tree’.

33. Replaces */[q]iɾy[u]/ cited in Hayes 1992:159. No reflexes found in Chamic, but cf. Malay {telər} ‘egg’. Limited to Katuic and Vietic in Mon-Khmer; the Juang form is an isolate in Munda, hence a speculative member of this comparison. Bondususur(ə) ‘plantain to appear on the tree’ and Sengoi {lor} ‘to bud, sprout (of a plant)’ may be reflexes of the underlying root.

34. Certain Munda reflexes indicate */qa/, whence Santali {hako} {ko} is a plural or class suffix. Since the voiceless postvelar generally shifts to */k/ after a nasal, a prefixed form, */nqa/, must be recognized as the source of the MK reflexes (and presumably the AN as well).
Katu kóót ‘lice, fleas, bugs’, Khmer saíkcek ‘bedbug, flea’, Chrau sicách ‘tick’

Bahnar kómók ‘a type of very small bee-like insect’, Thavung móry, Khmer műs ‘mosquito’

Bonda gubu ‘a kind of rat’, Riang (Black) kábú ‘rat, mouse’, Mah Meri (Bes. K. L., R33)³⁶ kané ‘rëbu’ ‘mouse’

Kharia lur, Sora loʔor (CF lor) ‘a kind of snake’, Bahnar ‘bih tep-lar ‘a very small snake that is extremely poisonous’

None³⁸

Pacoj tvarj apiaj ‘spider web’, Bahnar vai ‘spider’, Pearic tãkliv ‘butterfly’

None

Kóppa:-n, Mah Meri kômjhek ‘wing’, Khmer pák ‘shake, stir, agitate, wave, wag’

None

3.5. Anatomy (23/20)

Boriwen kúat ‘back’, Halang kuyq ‘small of the back of the

³⁵ Mah Meri {rëbu’) looks like an AN loanword, but no reflexes of PMP */labaw/ have been found in Chamic and Malay.

³⁶ Parenthetical identifications after the names of Aslian languages consist of the names and indicial numbers used with data found in Skeat and Blagden 1906. The language name correlations are taken from the concordance presented in Benjamin 1976:125–6.

³⁷ Replaces */u[I]jy(i)/ cited in Hayes 1997b:28. The meaning ‘snake’ is poorly represented in Austronesian, and it appears likely that ‘snake’ was not the original sense of the Austric root. That meaning may be reflected in OM {lor} ‘be supine (?) [hypothetically slor]’, from which Spoken Mon {lo} ‘lie supine, (snake) wriggle’, and (/glaːr/) ‘lie on one’s back’.

³⁸ Also cf. Bahnar {bih} and PMN */bìs/ ‘snake’, which may be reflexes of */mpays/ or the like, but cannot be presently disambiguated from reflexes of PAA */(um)pac(i)/ ‘poisonous snake’, cf. PMP *upas ‘poisonous, as a snake’.

³⁹ The root was presumably */wa/, whence reflected forms */wai, lawaʔ/, etc. It seems unlikely that Mah Meri (Bes. K.L., B479) {awáj ‘large butterfly’ and Mendriq (Pang. Gal., S378) {tawáːj ‘spider’ were borrowed from Malay {labu labu} ‘spider’ or Acheh {gélabah} ‘cobweb’.

⁴⁰ Semantic shift from ‘back’ to ‘upper back’ to ‘back of neck or head’ to ‘head’ is evidenced in the MK languages which possess reflexes of this word. The glottalized {yq} [ʔ] final occurs only in the two closely related Bahnaric dialects cited above, and it implies a dissimilated *iː. This fact could suggest that the word
head', Jeh kung kuyq ‘back of head’
Sora ta'al ‘spleen’, Thavung kha'al ‘belly, stomach, abdomen’, Pacoh acheal ‘heart’
None

*Santali (V7) jan, Lamet snar, Jehai ja?i? ‘bone’
Bonda da?tu kuµ, PW *tis ‘breast’, Semai ntor ‘chest’
Rengao ik kring, Chrau ãch ãng ‘ear wax’, Sre klïn tür ‘outside part of ear’
Kharia (V250) mo-ci, PVM *mat ‘eye’, Proto-Plang *hakl kita?i ‘eyebrow’
Semai möcok ‘fat (grease)’, CN maw ‘coconut oil’
Bonda tpu-sor ‘oil made from marrow’, surle?mi, OM simnor ‘nasal mucus’
Che’ Wong tach, CN aic ‘belly’, [*]aqi, *laqi
*Santali (K282) laj ‘stomach, belly’, Chrau talaq ‘intestines’

was borrowed from AN, but the only possible Chamic reflex detected is Chru {khµt} ‘back of head’, with an anomalous earlier */gh/- and a final */t/. The Boriven form indicates that the final evolved more likely as */di/ > */ji/ > */j/, a regular change in AA.

41. The Austric root was apparently */qan/, whence */tuqalaj/ > PAN */tuqela[n,n,ŋ]/. Such FO reflexes as Siraya *tu[ŋ]lal suggest that the root may have originally been */qal/, but the final lateral in those forms may be secondary.

42. */s/ > */t/ in the */ns/ cluster appears to be a post-PAA development.

43. Replaces */[qa](n)[qr]in/ cited in Hayes 1992:159. This comparison is somewhat speculative because it is based on the assumption that Rengao {k-ring}, Chrau {câng}, and Sre {kîn} meant originally ‘ear’. Rengao {ik} and Chrau {ăch} signify ‘defecate’, Sre {tür} ‘ear’, but the meaning of {k-ring}, {câng}, and {kîn} is not specified in the available glossaries. Note, however, the similar Khasi construction {eit-kor} ‘ear wax’, where {eit} means ‘excrement’ and {kor} ‘ear’. Also cf. Jeh {kîng klik} ‘be deaf’ and {jîng} ‘deaf and dumb’ where {kîng} and {jîng} may be reflexes of the Austric root */[q]en/, whence */[q][r]ena/ > AN */talin/, cf. AT */(N)qràln[a]/ ‘ear’.

44. Stress shift is indicated in Austroasiatic, as in */matåq/ > */matåq/ > */måtsa?/ > */mât/. In a few reflexes like Proto-Plang *hakl kita?/ ‘eyebrow’(*hakl/ ‘hair’), stress shift is not apparent.

45. Apparently limited to Central Asian and Nicobar, this word cannot be accounted for as an AN loan due to the medial cluster. Also cf. Bonda {su?} ‘oil, ink’ and VN {nhùra} ‘sap, gum, tar, resin’, which suggest the variant */(ii)c[o]q/.

46. This comparison is based on the assumption that the Austric root was */sNγ/ and PMP */hmaR/ reflects an infixed derivative */smay/ of the */say/ root variant.
Bonda kirim-ti ‘fist’, Brou
ndeim atēi, Khmer mrām
‘finger’
Bahnar (PB) kēl, Jeh kāl, Mal

MUK kel ‘neck’, Pacoh cōl
‘wear around neck’, Sengoi
kelkeil ‘ankle, wrist’
None
Kharia tara, Theng blah
‘shoulder’, Khasi ta-bla ‘shoul-
der piece of animal’
NK taklet ‘scales, scab’
Bonda le?an, PVM *las, Brou
liaih ‘tongue’

47. The AN numeral ‘five’ is derived from the word for ‘hand’, cf. AN (Lopez, no date) */limah/ ‘five, hand’. The same derivation is observable in AA, cf. Stiëng {pram} ‘five’ from */plem[a]/, VN {lām, nhām} ‘five’ from */(n)lem[a]/, and Alak {dam} ‘five’ from */[p]nlem[a]/.

48. PMP */buhek/ represents perhaps a morphemically shifted variant or doublet, cf. (*/busuk/ >) AN
(Lopez) */buhuk/ ‘hair’, which PC */būk/ reflects instead of */buhek/.

49. It is unclear to the writer whether or not PC */pha/, which is a continuation of AN (Dempwolff 1938)
*/paa/ ‘leg, stalk, stem, thigh’, cf. also AN (Dyen and McFarland 1970) */pąaqu[ʔ,h]/ ‘thigh’, and PC
*/takai/ ‘foot, leg’, the AN antecedent of which is unknown, are related to PMP */qaqay/. Possible AA corre-
spondents exist for */pąaq[ʔ,h]/, but not for */qaqay/.

50. By itself, this word denotes infrequently a body part, cf. also Katu {palai} ‘stomach’ and Khasi {khyllai}
‘the kidneys’; its more common meaning is ‘fruit’, but it often occurs as a classifier of such parts, cf. Chrau
{play nuiĮ} ‘heart’ and Rengao {pли ho’них} ‘muscle’, among others.

51. The Aslian forms may reflect */mpaŋ/ŋ/, since */ŋ/ > /k/ is common in that area, but */(m)pan/ probably
developed from */(m)pąaq/ or */(m)paqpaq/.

52. The sole example, but it is difficult to account for this word by borrowing because Nyah Kur is located in
Thailand and a good distance from the nearest Chamic speakers.

53. Also cf. Khasi {jiaŋ} [jiaʔ] ‘lick’, which reflects most faithfully the form and possibly the meaning of
PAA */di[a]ŋ/.
Mon dañap ‘back tooth, molar’, Sengoi lemuin tengep ‘molar teeth’

**[taN]Gep** PMP *ipen/nipen ‘tooth’

Kharia (K535) sou ‘husband’, Katu sasau ‘father’s cousins, sister’s husband, father’s sister’s children’, Proto-Semai *bsnasa ‘wife’s elder brother’

**saw[a]** PMP *qasawa ‘husband, wife’

---

54. Limited to Mon and Sengoi, but retention of the medial velar indicates that this is not an AN loan. Note that some Austronesianists also propose reconstruction of a velar, cf. AN (Capell 1943) */ŋi%pɛn/, (Benedict 1976) */(ŋ)Gipən/ ‘tooth’.

55. Cf. AT */[kə](m)puŋ/, AN (Dempwolff) */ka(m)puŋ/ ‘belly’.

56. This comparison suggests that the postvelar spirant */R/ may represent an ancient */ʁ/ cluster in some cases. Also cf. AN */[d,D]uRih/ ‘thorn’.

57. The POC form is probably a reflex of AN */Ruŋaŋ/ ‘hollow space, throat’, cf. also Malay {kəŋϱngkong} and Chru {roʊkong} ‘throat’, the latter probably a MK loan.

58. The Austroasiatic root may have been */quʔak/, cf. Katu {vok} ‘boy, son’, in which case the AA and AN reconstructions are infixed forms. Mintil plausibly reflects the */[ak]/ final via */quʔan[ak]/ > */uwaŋk/ > {?awã?} [a = nasalized vowel], cf. also K ensi {wəŋ} ‘child’.

MKS 29:1-34 (c)1999 See archives.sealang.net/mks/copyright.htm for terms of use.

3.7. Cultural artifacts (6/6)

Mundari (V200) ora? ‘house, building’, Bonda ngom ‘village’, VN (*šu:m >) thum ‘hut on stilts used by hunters’

Kurku (V279) jimu, jumu, OM yamo’/ymo’/himo’ ‘name’, Chrau tanhya ‘to name’

VN (*[k]lom >) trâm ‘hairpin’

**[u]yaq, *(sun)yum[aq]⁶⁴

PMP *Rumaq ‘house’⁶³

PMP *ŋajan, PC *ʔanānʔanān ‘name’

PMP *zaRum, PC *jurūm ‘needle’

60. The only known AA examples. Despite the homophony, this etymology is apparently distinct from PMP *t-ina/ ‘mother’.

61. The Kharia word is apparently analyzable into {gom} ‘house’ and {ke} ‘man’, cf. Bonda {ŋom} ‘village’ (see ‘house’ under Subsection 3.7).

62. The Kharia form is an isolate in Munda, but this etymology is well represented in Mon-Khmer. Pacoh {avu-avang} ‘small boy’ and {avōq} ‘grandfather’ may reflect the root */awu(q)/, whence */tawu[q]/ > AN */[t]awu[h]/, but most reflexes evidence prefixation by */l/ or */k(a)/.

63. No reflexes found in Chamic, but cf. Malay {rumah} ‘house’.

64. The old */sr/ cluster, which has coalesced in Vietnamese, cf. also Katu {sum} ‘shelter’, is maintained in a MK loan in N Rogliai {craq srum} ‘hunt from a blind’. Reflexes of the root also occur in MK, cf. Pacoh {croq} ‘shed, shelter, pen, sty (for pigs or buffalo)’, Mon {pra}’ {praʔ} ‘lean-to at end of house, used for storing paddy’.

65. The AA data suggest an ancient compound composed of */ja/ and */m[u]s/.

66. This word has been borrowed into Mon-Khmer from Chamic and Malay, cf. Katu {jarum} ‘needle’, but the VN form does not appear to be a loanword.
Kurku kora ‘way’, PW *kra?, *k(a,u)la$^{67}$  PMP *zalan, PC *jalân ‘road’
Pear khra ‘road’  
Sora tare:1-on ‘string, thread’, *taλ  PMP *talih ‘rope’, PC *talɔi ‘cord’
Thavung atal ‘cord, thread’,  
Pacooh ntar ‘cord, single handle, basket straps’
Khasi tap ‘to cover’, Mundari *(n)tęp  PMP *qatep ‘thatch’
(V3) da'b ‘cover a roof, thatch’,  
Palaung dęp ‘to cover, thatch’

3.8. Descriptives (35/23)

Boriwen kɔya? ‘bad’, Ta-Oy *fiqi ‘false’, VN dịr ‘fierce, ferocious, wicked’
PW *ra? ‘big’, Theng ya? ‘far’, *(c)anγay(q)$^{69}$  PMP *ma-Raya ‘big’
Sora (V40) saŋa:j-on ‘be at a distance’
Katu tam ‘black’, PM *prtam ‘night (time)’, Sora süm ‘grope in the dark’

Kharia (K208) ranga, VN lanh ‘cold’, Khmer sreñ ‘to cool’
Sengoi bor ‘good, fine, beautiful’, bærn ‘goodness, righteousness, true’, Pacoh mnør ‘happy’
Mon mih ‘body dirt’, Mintil kamah ‘dirty’

$^{67}$ This comparison is based on the assumption that the Austroic root */la/ is incorporated in PMP */zalan/.
Also cf. Khasi {lād} [la:t] and Pachoh {cama} ‘road’, the latter hypothetically from */kalan/ or */kalana/ > */karna/.

$^{68}$ Chamic appears to have two sets of reflexes: Rade {jhat} ‘damaged, bad’ clearly continues PC */jhat/ (more likely */jahat/), but WCham {kadjah} ‘bad’ must be borrowed from Mon-Khmer. The MK forms suggest that the Austroic root was */zVq/, whence */dzaqat/ > AN */zaqat/ and */dz(a,a)q/ > AA */nj(a,a)q/ > */nj(a,a)q/. Chrau {dagat} ‘deceive’ apparently reflects the variant */nzanqat/.

$^{69}$ This etymology is well represented, but retention of the root and semantic differentiation are significant evidence that these are not AN loanwords.

$^{70}$ This comparison is based on the assumption that Austroic */z̥en/ > */̥en[an] or */̥en[gan] > AN (Dempwolf 1938) */Dinjìn ‘cold, cool, fresh’, cf. AT */(q)̥en/ ‘cold, cool’. Also cf. Katu {ŋoön} ‘cold season’, Pacoh {tangan} ‘cold (water, anything but people)’, Katu {rangaa} ‘cool’, VN {nguəi} ‘cool off, become cold’ as plausible reflexes of */lənga(n,i)/.

$^{71}$ The only available examples, but retention of the root and semantic differentiation are significant evidence that these are not AN loanwords.

$^{72}$ Austric */z/ > AN */-D/, AA */-z/, whence MK */-s/ > */-h/. This is the only AA example of final */z/ found to date. The question mark after the PMP reconstruction is Blust’s.
Sora pəɾən ‘be dried up’, PMN *p(a,u)yaŋ PMP *ma-Raŋaw ‘dry’
*prəŋ, Khmer prən ‘dry, rainless’

Pacoh tūl múl ‘(expressive) of blunt end’, Bahnar tūl ‘dull, not pointed’, NK thuul ‘blunt, not pointed’
PMP *pundul ‘dull/blunt’
None

Sora (V396a) jəru:-n, Khmu jru? ‘deep’, Temiar jəro? ‘long’
VN uóc ‘to desire, wish for, hope for’, Khasi kwah [kwaʔ] ‘wish for’, Jeh wā [waʔ] ‘want, like, be fond of, desire’
PMP *ma-pia ‘good’
None

Cua parəq, Chrau gât, Mendriq *baRe(n)qət (Pang. Gal., H68) hênjut ‘heavy’
PMP *ma-qudip ‘living/alive’, PC *hadip ‘to live’
PMP *anaďuq ‘long (objects)’
PMP *keptit ‘narrow’

None

Kharia (V93) japi’d ‘shut the eyes’, VN chât ‘be narrow, (of clothes) be tight’, Pearic çit ‘tight, be close’
PW *croʔ ‘new’, Bahnar chrēù *qi[R]u(q) PMP *bærəRu, PC *bahrəu ‘new’

73. Also cf. Sora {təu:l} ‘be stout’ as a possible Munda correspondent. The irregular */u://*d/ correspondence is plausibly explained by Austric */nt/ > AN */d/.

74. PMP */dumpul/ should probably be regarded as a metathesized variant of PMP */pundul/ cited just above. The Chamic proto-form is by the writer and based on Chru {buəl} ‘dull’, NRoglai {avon}, Rade {bəl}, and WCham {taβəl} ‘blunt, dull’. This word has been borrowed by Bahnaric and Katuic, cf. Bahnar {bəl} ‘dull (knife)’ and Pacoh {pəl} ‘dull because of use’.

75. Cf. Chru {jruh} ‘long’ and NRoglai {juaq} ‘length of foot’, which are not clearly continuations of PMP */zauq/. Chru {jruh} is more likely a Bahnaric loan.

77. PC */tr(o)ʔ/, based on Chru {trā}, Haroi {traqc}, NRoglai {ṭrāq}, Rade {krṭō}, WCham {ṭrauk} ‘heavy’, is not unambiguously a continuation of PMP */ma-beReqat/.

78. Early palatalization is indicated, i.e. */(n)kit/ > */cit/ and */jɨit/, whence pre-Munda */japit/.

79. Cf. PC */kapit/ ‘to close, pinch, press’ from AN */ka(m)pit/ ‘compress, hold together’, which is related to, but not a direct reflex of PMP */keptit/.

80. Only two correspondents have been found, but they are from different branches of Mon-Khmer and non-suspect as loans.
Khmer ចេះ, និមួយ ប្រុស ស្តី ‘old’, ប្រាប់ ឈុត ‘grown’

PMP *burak ‘white’
PMP *ma-putiq, PC *pitih ‘white’

81. The phonological development is obscure. Presumably, palatalization occurred, i.e. */tiqasi/* > */ticas/, after which the first syllable vowel was replaced and vocalic assimilation and/or shift occurred, as in */tacaś/ > */(ta)caaś/ and */ticas/ > */(ta)cuus/. The first syllable of Khasi {shado} ‘old’ may reflect a truncated */ca/,. Such forms as Rengao {krá} [kra?] ‘old’ and Sengoi {ngra} ‘old (of people and animals)’ indicate an alternate evolution, i.e. */(ta)nqra(q)/ > */ŋkraa(?)/.

82. This comparison is based on the assumption that PMP */burak/ reflects an earlier infixed form, cf. also PC */pirak/ ‘silver, money’, which is probably not a direct reflex of PMP */burak/. A */buk/ variant also occurs in Mon-Khmer.

83. This comparison is based on the assumption that Austric */(pu)p[1][e]q/ > AN */puti/, cf. AT
3.9. Verbs (73/53)

---

*p[u]p[r,]q[ə]/ ‘white, silver’. Benedict also reconstructs the variant AT *p[u][r,][u][q]/, to which Pearic
{prus} ‘white’ is apparently correspondent.

84. Also cf. Kharia (V334) {khəɔ} ‘to bite’, with {kh-} possibly reflecting earlier */kVg-/. The AA forms
may reflect */yat/ and */yət/; ablauted reflexes of Austroasiatic */γW/ which also underlies AN */kara/ ‘bite,
gnaw, nibble’ and */keRə/ ‘cut (off)’.

85. The final /0/ */p/ correspondence is seen in other comparisons, and the labial stop is sometimes present in
Austroasiatic and not in Austronesian, the reverse of the case here. It appears to have been a suffix used to
form verbal and descriptive attributives from nominal roots.

86. It is assumed that */n[r]/ > */ŋ/ in Austronesian, but it is possible that different initials are involved, */rV/
in Austroasiatic, */ny/ in Austronesian.

87. This comparison is based on the assumption that PMP */tunu/ reflects an affixed derivative */tunə/ of the
Austroasiatic */[u]s/.

88. The original meaning was probably ‘change, exchange’, cf. AT */pa-li, (m)ba-li/ ‘exchange, change, buy,
sell’.

89. Cf. PC */luə/ ‘choose’, which is probably borrowed from Mon-Khmer and quite likely a Kautic lan-
cuage, cf. Brou {ruəh} ‘choose’.

90. The Chamic proto-form is by the writer and based on Chru {morai} and WCham {mai} ‘come’.
91. Lee 1966:217 bases this PC reconstruction on Jorai {trah} ‘to sculpture’ and Roglai {taiah} ‘trim’, but
cites no definition for it.
92. This comparison is based on the assumption that PMP */hinum/ is an affixed derivative of the Austrian
root */?om/ ‘water’, cf. AN */[d,D]anum/, AT */(n)alom/ ‘water’. In Austroasiatic, the sense ‘drink’
is rare, but does occur, cf. Katù {ôm} ‘to drink’. Chrau {nöm} ‘urinate’ evidences the same type of inflexion
seen in PMP.
93. Alternatively, AA */(in)ka(q)an/ is reconstructible, cf. VN {ân} ‘eat’, Bahnar {raqan} ‘bite’, Pacoh
{pancan} [pankâ:n] ‘chew’, but it is unclear whether */[q,?]an/ is a suffixal construction or a root in com-
 pound with another root */ka/.

Khmer pêk, PM *pok ‘open’, **pok
PMP *buka ‘to open’⁹⁸

Jeh pôk chôk ‘remove, take off’

---

⁹⁵. This comparison is based on the assumption that */nt/ > AN */n/ > PMP */n/, cf. AN (Wolf 1993) */qaŋ/i ‘hunt’ (also see footnote 86). In Austroasiatic, cf. PMN /ŋiũp/ ‘grasp’.

⁹⁶. The AA forms may derive from an old causative, i.e. ‘cause to know’ > ‘teach’ and by trope ‘show’ and ‘persuade’. Also cf. Mon {tho} ‘to train, employ in a trade’ and PM */[d]ndoo?: ‘(Nyah Kur) headman, (Mon) teach, instruct’. Reflexes of a variant, */(n)eq(u) or */(n)taqi/, are also present, cf. VN {day} ‘teach’, Khmer {phte} ‘ordain, instruct’, Sengoi {pânei} ‘know’.

⁹⁷. Limited to Munda and North Bahnaric; however, cf. VN trò ‘game, trick, feat’ and tròu ‘tease, pester’, which suggest the variant *tlaw, viz. also AT */(n)tlaw[a] ‘laugh’.

⁹⁸. PC */pôk/ ‘to open’ is probably a MK loan.

PC *panāh* ‘shoot’

Katu ndūci ‘sit on ground’ {**d[a]l**} PMP *ma-tudan* ‘sit’
Pacoh chur ‘sleepy or sad’ *(n)zoγ* PMP *tīdūR/tūdūR* ‘sleep’

---

99. This comparison is based on the assumption that PMP *tanem* is a reflex of an infixed derivative *tanam/ of the Austroic root */tam/.

100. PC *ʔiau/ is based by the writer on a single example, Chru {jōū} ‘to strike’. It is unclear whether the Chru final glottal reflects the initial glottal transposed or an old final oral stop.

101. PC *tük/ is based by the writer on Chru {tōū}, NRoglai {toq}, WCham {tawk} ‘pound (rice)’ and Rade {tük} ‘punch’.

102. Pacoh {hear} ‘to scream, squeal (pig)’ indicates initial *q/, but the variant *kay/ may have occurred. Also cf. PW {gray} ‘to talk’ and Santali {karac kuruc’} ‘mumble, grumble’.

103. This comparison is based on the assumption that the Austroic root */Ra/ was prefixed differently in Austroasiatic and Austronesian. Actually, the AA forms may correspond more directly to AN */q(i)n(Tay/ ‘look (at)’, but AN */kīTah/ apparently contains the same root, cf. AT */[k]i(n)tra/ and AT */[k]i(n)tra/ ‘see’.

104. The phonetic development in Austroasiatic is obscure. EAA *(n)qis/ was cited previously, but it is possible that the earliest form was */q(i)/, whence */q(i) > */q(i)/ > */ʔes/, */nq(i)/ > */ni(ʔ) > */ʔi(ʔ)/, and */q(i)/ > */q(i)/ > */ʔes/ and */ʔe(ʔ)/. Also cf. Kharia {cugci}, Palaung (Pan- ku) {pāle?} ‘needle’, Pearable {tēy} ‘sew’, Tampuan {tanjia} ‘weave’ as other possible members of this etymology.

106. This comparison is based on the assumption that the Austroic root was */ʔaqa/ and the AN forms are reflexes of a causative construction incorporating that root, */pānaq/, which meant something like ‘cause arrow or bow to shoot’. A similar causative construction is apparently present in Austroasiatic, cf. PM */pān/ ‘to shoot’, but it is not clear that the AA and AN forms derive from a common Austroic form. The phonology is obscure, but the AA development may have been */pānāq/ > */pānāqi/ > */pānāqi/ > */pānāqi/ > */pānāqi/ by stress shift, syncope, and apocope. Also cf. Jehai {bana?} ‘quiver (for darts)’ and Stieng {rah} ‘to shoot’ as other possible examples incorporating the same root.
eyes’, Birhor (V111) durum ‘to sleep’, Khmu hmdir ‘to snore’

PMP *i-k-ita ‘we (inclusive)’
PMP *i-kahu ‘you’
PMP *kamiu ‘you (plural)’
PMP *i-kamu ‘you (plural)’

111. PC *lakaw is based by the writer on Rade {həgəo} and WCham {ləkəo} ‘go past, step over’.
112. Found only in Nyah Kur, cf. AN *qumah/ ‘cropland, garden, orchard’. PW *mar/ ‘field’ and Chrau *mir/ ‘swidden field’ may reflect an infixed derivative */ma[l]rq/, cf. AT */[(N)j]um[a]l(h)/ ‘cultivate (field), field’.
113. The only Chamic reflex found, Rade {hoap} ‘yawn’, is probably borrowed from Mon-Khmer.
114. Cf. PC *ʔʔʔ, *hʔʔʔ/ ‘to vomit’, either onomatopoetic or borrowed from Mon-Khmer.
115. Cf. PC *hə ‘you’.
3.11. Numerals (4/2)

Kharia (K338) mőj, MUK mőch, PM *muay ‘one’  
Sora ruːː-n, Katu madruːh ‘together’, Pacoh rõː, tői ‘pair’  
None  
None  
PMP *i-k-ita ‘we (inclusive)’  
PMP *i-kahu ‘you’  
PMP *kamiu ‘you (plural)’  
PMP *i-kamu ‘you (plural)’

116. The Austric root was apparently */tsa/, whence AA */(i,a)ca/ and then */mu[?]ica, mu[?]aca/ by affixation (the numeric prefix */mu/ occurs with other cardinal numbers). The latter forms were reduced by stress shift and syncope, e.g. */mu[?]aca/ > */mu[?]āca/ > */muac/ > MUK {mőch}.

117. Speculative. This comparison is based on the assumption that the root initial */r/ occurred optionally as prefixed */dr/, the latter shifting to AN */D/, cf. AN (Lopez) */Duhaw/ ‘two’, whence PMP */duha/, cf. also Li */dרא/.  

118. Cf. AN (Dempwolf 1938) */babaw/ ‘outside, surface, top (part/side)’ and */ha(m)baw/ ‘above/lie above, high’ which apparently contain the same stem, */baw/.

119. Katu {diː} is not a Chamic loan; it is not clear that Chamic possesses a reflex of PMP */di/ (see next footnote). Also note Bondo {di} ‘an ablative suffix’.

120. Cf. PC */tiː/, for which Lee gives no definition, based on Roglai {ti} ‘in, on, at’, among others. Cf. also N Roglai {di} ‘from’.

121. Found only in Bahnaric thus far. The Bahnar and Chrau forms may be borrowed from Chamic, but PAA */zaːlm/ would apparently result in Bahnar {solam} by regular changes.

122. Speculative. The Boriven form is an isolate, but unlikely to have been borrowed from Austronesian, for Chamic apparently possesses no reflexes of PMP */hazan/ ‘near’.

3.12. Prepositions (9/5)

Chrau ḍuːq ‘in front’, Jeh ḍuːq ‘top’, Chrau ḍuːq ‘hilltop’

4. Some indications of the comparison

4.1. Degree of correspondence. In Table 2, the degree of the AA/PMP lexical correspondence revealed by the basic vocabulary comparison in Section 3 is portrayed statistically. The MK/MU column gives the number of comparisons which are valid only for one or the other AA subfamily, the AA column those valid for the family. The Total column is the sum of the MK/MU and AA columns. The PMP column gives the number of PMP comparisons in each category. The AA/PMP column is the quotient of the AA column divided by the PMP column; the Tot(al)/PMP column the quotient of the Total (AA) column divided by the PMP column.

The table reveals that potential AA correspondents were found for just over two thirds (70.0%) of the PMP reconstructions. However, when only AA

123. NRoglai {mā} ‘and’ is the only Chamic correspondent found, and it may be a VN loan.
124. Cf. PC */kaiua/ ‘because’.
125. PC */(?a)ka/ ‘not yet’ is a possible reflex.
126. PC */tukOn/ ‘other’ is not unambiguously a continuation of PMP */liqan/.
127. Cf. PC */hiː/ ‘there’, plausibly a reflex of AN */(q)iya[n,N]/ ‘when?’.
128. No Chamic reflex has been found, but cf. Chru {aràng soi} ‘who’. WCham {hay} ‘who’ would appear to be borrowed from Mon-Khmer, cf. Ruc {ay} ‘who’.
129. This comparison assumes that the PAN initial is a prefix and that the Austrian stem was */a[?]i/, cf. also AN */s+ai/ ‘who?’ where the plus sign apparently indicates that */s/ is a prefix.

correspondences with representative forms in both AA subfamilies are considered, the degree of correspondence falls dramatically to about two fifths (40.5%).

In Table 3, the PC correspondences are brought into the picture. It is noteworthy that the PC/PMP correspondence (43.0%) is only slightly higher than the AA/PMP correspondence (40.5%), even though PC correspondences outnum the AA in six of the 12 categories.

4.2. Implications of the statistics. The degree of lexical correspondence between Austroasiatic and Malayo-Polynesian indicated by the statistics cited above is surprisingly high. If the AA lexical data had come from a conventional basic vocabulary list usable in a glottochronological computation, the inferred time depth of the
PAA/PMP relationship would be less than that found by other researchers to exist between some branches of Mon-Khmer. The methodological approach used in discovering AA correspondents has obviously and significantly skewed the degree of correspondence in favor of the proposition that Austroasiatic and Austronesian are genetically related. In the writer's opinion, however, the fact that this distortion exists takes nothing away from the validity of this correspondence or its value in providing probative evidential support for the verity of that proposition.

The degree of lexical correspondence indicated by Table 2 thus implies that Austroasiatic and Austronesian are indeed genetically related and perhaps more closely than even Schmidt may have envisioned. When one recalls that loanwords have been eliminated from the comparison, no other conclusion seems possible.

5. Conclusion

The nature and degree of the lexical correspondence portrayed above lead to only one conclusion: Austroasiatic and Austronesian are genetically related. As such, they have inherited a large volume of common lexical material of both basic and non-basic vocabulary types, only some of which has been demonstrated in Section 3. When the probative phonological and morphological evidence Schmidt presented in 1906 are considered together with the lexical evidence shown here, it becomes clear that he was right after all; Austric is a valid language construct and an appropriate taxonomic entity uniting the AA and AN language families.
