Verbal affixation in Pacôh

SAUNDRA K. WATSON

0. Introduction
1. \(\text{Pa-}\) Causative prefix
2. \(\text{Tar-}\) Reciprocal affix
3. \(\text{Par-}\) Causative-reciprocal prefix
4. \(\text{Ti-}\) Resultant-state prefix
5. \(\text{Ta-}\) Involuntary prefix
6. \(\text{Par-}\) Nominalized-action prefix
7. \(-\text{an-}\) Nominalizer infix
8. Continuative reduplicated prefix
9. \(\text{Ca-}\) Completive prefix
10. \(\text{N-}\) Pretence prefix
11. \(\text{Pi-}\) Causative verbalizing prefix

O. Introduction

Affixation is of particular interest in Pacôh\(^1\) because of its widespread use in the language. Affixes occur on verbs, nouns, pronouns, modifiers, numbers, kinship terms and others. Affixation in Pacôh consists of prefixes and infixes.

\(^1\) Pacôh is a member of the Mon-Khmer language family and is spoken by approximately eight to ten thousand people in Thừa-Thiên Province of Việtnam. It may be mutually intelligible with some dialects of Ta-Oi in Laos.

I am indebted to our language informant, Cubust, for providing the data used in this analysis. His ability to write test material illustrating the use of the different morphemes has greatly facilitated my analysis.

I wish to express my appreciation to David D. Thomas, also of the Summer Institute Linguistics, for his suggestions and help in the organization and presentation of this.
A noteworthy feature of Pacôh affixation is the contrastiveness of vowel which occur in open-syllable prefixes (e.g. a, i, u). This type of vowel contrast in prefixes has not been reported before in a Mon-Khmer language, to my knowledge. Prefixes in Mon-Khmer languages are primarily consonantal with a neutral vowel. Pacôh has a similar vowel neutralization, but only in closed-syllable prefixes. This neutralized vowel [ə] in written a.

The phonological word in Pacôh can be summarized as: \(+\) presyllable \((C_1V + C_2)\) + main syllable. The morphological division of monosyllabic root plus prefix corresponds to the phonological division of main syllable plus presyllable. Morphologically complex words (i.e. monosyllabic or disyllabic roots with affixes) are bound by the same phonological limits as morphologically simple words.

Among Pacôh verbs, disyllabic roots are a definite minority. It is supposed that many of the roots which are now considered to be disyllabic may prove to be root plus affix upon further investigation. For example, the verb padâm ‘to oppress’ may be said to consist of pa-‘causative’ prefix plus the root dâm although dâm does not occur in the data as a free form.

This paper presents the affixes which occur with verb roots and the verbalizing affixes which occur on non-verb roots. The affixes discussed in this paper are derivational. Pacôh has two prefixes which can occur with all monosyllabic verbs and may be considered inflectional. These prefixes, u- ‘third person singular pronoun’ and i- ‘indefinite person pronoun’ are discussed in an article on pronouns and in an article on clause structure.

In text material, approximately one out of every two sentences will contain an affixed word with affixed verbs making up the greatest part of this number. The Pacôh dictionary currently contains 685

Sandara K. Watson, "Personal Pronouns in Pacôh" Mon-Khmer Studies I, Saigon, (1964)

Richard L. Watson "Pacôh Clause Structure" (to be published).
VERBAL AFFIXATION IN PACOH

monosyllabic verbs and 430 disyllabic verbs from which this study was made. The number of occurrences is stated in parenthesis after the affix and its allomorphs.

1. \langle Pa- \rangle Causative prefix.

The causative prefix \langle pa- \rangle means 'to cause, allow or be responsible for an action taking place.' \langle Pa- \rangle has allomorphs \textit{pa-} (206), \textit{ta-} (62), \textit{a-} (14), \textit{ca-} (3), \textit{pi-} (9), and \textit{ti-} (5). \textit{Pa-} can also occur with twenty-eight of the verbs that \textit{ta-} does and with seven of the verbs that \textit{a-} does. \textit{Pa-} and \textit{ia-} can both occur with two of the verbs that \textit{ti-} does. It is not possible to predict which verbs will be able to take the causative. Neither is it possible to predict, entirely, which allomorphs of the causative prefix will occur with which verbs. Although the allomorphs of the causative prefix are not strictly conditioned there are some phonological trends which can be recognized. A verb root beginning with \textit{b} or \textit{p} is more likely to take the \textit{ta-} allomorph while a verb root beginning with \textit{t} will take the \textit{pa-} allomorph.

Some examples of words which take the causative prefix are:

\begin{itemize}
  \item \textit{cláq} ‘to prop’
  \item \textit{clâu} ‘to answer riddle’
  \item \textit{dér} ‘to shatter’
  \item \textit{héar} ‘to scream’
  \item \textit{hoc} ‘to study, learn’
  \item \textit{kéo} ‘to hug’
  \item \textit{bi} ‘to reply’
  \item \textit{biq} ‘to lie down’
  \item \textit{cuam} ‘to wrap in blanket’
  \item \textit{hóm} ‘to bathe (oneself)’
  \item \textit{mót} ‘to go in’
  \item \textit{xár} ‘to go up’
  \item \textit{yör} ‘to stand’
  \item \textit{púng} ‘to cover’
  \item \textit{hao} ‘to spend’
  \item \textit{tôq} ‘to pour’
  \item \textit{pacláq} ‘to cause to prop’
  \item \textit{paclâu} ‘to ask riddle’
  \item \textit{padér} ‘to cause to shatter’
  \item \textit{pahear} ‘to cause to scream’
  \item \textit{pahoc} ‘to teach’
  \item \textit{pakeo} ‘to cause to hug’
  \item \textit{pa-bi} ‘to cause to reply’
  \item \textit{pabiq} ‘to cause to lie down’
  \item \textit{pa-} /\textit{tacuam} ‘to cause to wrap in blanket’
  \item \textit{tahóm} ‘to bathe (another)’
  \item \textit{pa-} /\textit{amót} ‘to take in’
  \item \textit{axár} ‘to raise up’
  \item \textit{ayör} ‘to cause to stand’
  \item \textit{capúng} ‘to cause to cover’
  \item \textit{pihao} ‘to cause to spend’
  \item \textit{pitôq} ‘to cause to pour’
\end{itemize}

MKS 2:15-30 (c)1966 See archives.sealang.net/mks/copyright.htm for terms of use.
côt 'to bend double'  ticôt 'to cause to bend double'
deng 'to heat'  tideng 'to cause to heat'

Causative prefixes occur primarily with monosyllabic verb roots. However, the allomorph pa—does occur with some (20) disyllabic verb roots replacing the presyllables.

adu 'to get under shade'  padu 'to put under shade'
ahét 'to smell'  pahét 'to cause to smell'
angò 'to rest'  pangò 'to cause to rest'
anhöri 'to play'  panhöri 'to cause to play'
aruam 'to land on spike'  paruam 'to cause to land on

ayrn 'to dance'  payrn 'to cause to dance'
rnghâyh 'to think'  pangâyh 'to cause to think'
rnguth 'to think'  pangôth 'to cause to think'

When a causative verb is used in a clause the object slot can be filled, in its fullest form, by a clause. The components which make up this clause filling the object slot differ according to whether the verb is a transitive causative verb or an intransitive causative verb. Transitive causative verbs are formed from transitive verb roots and intransitive causative verbs are formed from intransitive verb roots.

(1) Transitive causative verbs. The clause filling the object slot following a transitive causative verb is composed of: Actor - Verb root-Goal.

Acâp ngâh pa-ac a-em ac achiu 'Don't you allow-play child play knife' 'Don't you let the child play with the knife'.

The object slot in a clause containing a transitive causative verb may be filled by a clause or by a part of a clause as seen in the examples below:

a. Actor only
Acâp ngâh pa-ac a-em 'Don't you allow-play child'

b. Actor + Goal (occurring contiguously)
Acâp ngâh pa-ac a-em achiu 'Don't you allow play child knife'

c. Goal
Acâp ngâh pa-ac achiu 'Don't you allow-play knife' (here the actor is understood).

When the object slot is filled by a single noun, the situation seems to
indicate whether it is the actor or the goal.

Transitive causative verbs can be further subdivided by the requirement of some verbs to repeat the verb root in the clause which fills the object slot. It is not possible to predict which verbs will occur in each subdivision.

(a) With some transitive causative verbs it is necessary to repeat the verb root when both the actor and goal occur in the clause which fills the object slot. For example:

Pacha a-em cha doi 'Cause-eat child eat rice'

Some verbs in this category are:

- pacha 'to cause to eat'
- pacui 'to cause to carry on back'
- padai 'to cause to wear (loincloth)'
- padoal 'to cause to carry on shoulder'

(b) With some transitive causative verbs the repetition of the verb root with actor and goal is optional.

Acap ngah pa-ac a-em achiu 'Don't you cause-play child knife'

or:

Acap ngah pa-ac a-em ac achiu 'Don't you allow-play child play knife'

Some verbs in this category are:

- pa—ac 'to cause to play with'
- pacap 'to cause to bite'
- pacong 'to cause to wear on wrist'
- pacrang 'to cause to carry between two people'

Below is a listing of some of the transitive causative verbs:

- pa—ac 'to cause to play with'
- pa—aq 'to cause to do without'
- pacleau 'to cause to carry at waist'
- paclin 'to cause to stare'
- paburam 'to cause to chew'
- pacuam 'to cause to roll up (in blanket)'
- pa—ep 'to allow to demand'
- pakho 'to cause to roast (fish)'
- tacong 'to cause to wear on wrist'
taheng 'to cause to warm by fire'
tangoiq 'to cause to drink'
taxip 'to cause to wear'

(a) Intransitive causative verbs. The clause filling the object slot following an intransitive causative verb is composed of: Actor + Verb root Ngâh paclón a-em olôn 'You cause-play child play' or Ngâh paclón a-em 'You cause-play child' (In this second example the verb root is understood).

However, when an inanimate or inactive animate item fills the object slot the verb root cannot occur (e.g. May paxâr acôq cu tôq dúng 'You take up my bushknife to house' but not: May paxâr acôq cu xâr tôq dúng 'You take up my bushknife go up to house').

Below is a listing of some of the intransitive causative verbs:

pa-át 'to cause to be át'
paclón 'to cause to play'
paclua 'to cause to slip down'
pacôp 'to cause to bow'
pacôy 'to cause to lie down (animal)'
paxâr 'to cause to go up (take up)'
payôr 'to cause to stand up'

2. (Tar) Reciprocal affix.

The meaning of the reciprocal affix is 'to do something to each other'. It sometimes carries the idea of antagonism. (Tar-) has two allomorphs: the prefix tar- which occurs with monosyllabic verb roots, and the infix -r- (phonemically /-ər-/) which occurs with disyllabic verb roots. The verb root can optionally be repeated after a reciprocal verb (e.g. tông 'to talk tardông (tông) 'to talk to each other' ; cachâng 'to laugh' carchâng (châng) 'to laugh at each other').

The reciprocal is one of the most common affixes in the language occurring with 467 monosyllabic verb roots and with 151 disyllabic verb roots.

Some of the verbs which can take this affix are:

chao 'to threaten'
chât 'to stab'
bôn 'to have'
tarchao 'to threaten each other'
tarchât 'to stab each other'
tarbôn 'to have each other' (marriage)
VERBAL AFFIXATION IN PACÔH

\[ \text{tiq ' to obey } \]
\[ \text{tong ' to talk } \]
\[ \text{xua ' to look for } \]
\[ \text{cap ' to bite } \]
\[ \text{acuan ' to hit } \]
\[ \text{achung ' to instruct } \]
\[ \text{ahet ' to smell } \]
\[ \text{cachang ' to laugh } \]
\[ \text{cuhör ' to glare } \]
\[ \text{culet to stick out tongue } \]
\[ \text{kiduh ' to bump } \]
\[ \text{kidyö̂l ' to cling to } \]
\[ \text{tarbiq ' to obey each other } \]
\[ \text{taríng ' to talk to each other } \]
\[ \text{tarxua ' to look for each other } \]
\[ \text{tarcap ' to bite each other } \]
\[ \text{rcuan ' to hit each other } \]
\[ \text{rcharg ' to instruct each other } \]
\[ \text{rhet ' to smell each other } \]
\[ \text{carchang ' to laugh at each other } \]
\[ \text{carhong ' to glare at each other } \]
\[ \text{carlet ' to stick out tongue at each other } \]
\[ \text{carduh ' to bump each other } \]
\[ \text{cardyö̂l ' to cling to each other } \]

A phonemic note should be added here to explain why the \( r- \) in \( rcuan \), \( rchang \), \( rhet \), etc. is considered an infix rather than a prefix. The presyllable in Pacôh, according to the predominant C and V pattern, consists of \( C1V + C2 \). Therefore, words written as vowel-initial have been interpreted phonemically as \(/ aV/ \) (\( acuan / akuan \)). Words written with a single nasal or liquid in the presyllable have been interpreted phonemically as \(/ aC/ \) (\( rcuan / arkuan \)). Thus the affixed \( r- \) above can be seen as infixed into the presyllable.

3. (Par-) Causative-reciprocal prefix.

The meaning of this causative-reciprocal prefix is 'to cause each other to act'. The prefix (\( par- \)) with its allomorphs \( pa- \) (38) and \( ca- \) (4) is a combination of two affixes — the causative prefix (\( pa- \)) with two of its allomorphs \( pa- \) and \( ca- \) and the reciprocal infix -\( r- \) which is an allomorph of (\( tar- \)) This is the only known case of two affixes occurring simultaneously on a verb root in Pacôh.

The causative-reciprocal verb can be optionally followed by the verb root, as can the reciprocal verb (e.g. \( parclau clau ' to cause each other to answer ' \).

Some examples of causative-reciprocal verbs are given below.

\( chom ' to know ' \)
\( parchom ' to cause each other to know ' \)
cha 'to eat'  pacha 'to cause each other to eat'
châu 'to argue'  ear-/parchâu 'to cause each other to argue'
dóc 'to be angry'  pardóc 'to cause each other to be angry'
heng 'to warm by fire'  parheng 'to cause each other to warm by fire'
hôm 'to bathe'  parhôm 'to cause each other to bathe'

4. ⟨Ti-⟩ Resultant - state prefix.⁶

⟨Ti-⟩ occurs on some monosyllabic verbs; the word formed by adding the prefix expresses a resultant state. The prefixed verb fills the predicate slot in a 'resultant-state' clause. This prefixed verb can take an object but not a subject.

Examples of sentences containing a resultant-state clause:
xeang táq ngéq ticut abúng 'Wind made all broken bamboo'
Along catính do cðh tidáyah pilau 'Tree hit him so broken leg'
⟨Ti-⟩ has two allomorphs, ti-(1) and tu-(2). Verbs which have been found to occur with the 'resultant-state' prefix are listed below:

áh 'to divide'  ti - áh 'to be divided, split'
caq 'to straighten'  ticaq 'to be straightened'
cloq 'to push'  ticuloq 'to be pushed'
dáyah 'to break'  tidáyah 'to be broken'
heq 'to tear'  tihég 'to be torn'
cut 'to break down'  ticut 'to be broken down'
lai 'to cast, unroll'  tilai 'to be unrolled'
ngóp 'to duck head'  tingóp 'to be lowered (head)'
óh 'to snap (break)'  ti - óh 'to be snapped'
viaq 'to wring, twist'  tiviaq 'to be twisted'
xón 'to push, crowd'  tixón 'to be mussed up, wrinkled'
yot 'to stretch'  tiyot 'to be stretched'
pil 'to pull out hair or feathers'  tupil 'to be pulled out'
póh 'to open (door)'  tupóh 'to be opened'

⁶ This resembles the affixes called 'attributive' by Jacob and 'passive' by Banker (Mon-Khmer Studies I, by Banker, Miller, Watson and Thomas, Linguistic Circle of Saigon and Summer Institute of Linguistics, 1964):
5. (Ta-) Involuntary prefix.

(Ta-) has the meaning 'involuntary or accidental action'. It can occur with many (346) monosyllabic verbs but is not found on disyllabic verb roots.

- cha 'to eat'
- chôh 'to plant'
- chông 'to burn'
- dyeal 'to take'
- lûq 'to pull'
- nhông 'to look at'
- pênh 'to shoot'

- tacha 'to eat accidentally'
- tachôh 'to plant accidentally'
- tachông 'to burn accidentally'
- tadyeal 'to take accidentally'
- talûq 'to pull accidentally'
- tanhông 'to look at accidentally'
- tapênh 'to shoot accidentally'

Whenever the ta- prefix is used the function word cray is obligatory to the construction. Cray can also be used alone with unaffixed verbs to mean 'involuntary or accidental action.'

*Cray car cha déi amiang ' (Accidentally) I ate rice brother's ' 
*Cray car tacha déi amiang ' I accidentally ate rice brother's '

The 'involuntary' verb in its affixed form can be optionally preceded by a reduplicative particle which is formed by putting the first consonant of the verb with -âh (e.g. cháh tacha, láh talûq, pâh tapênh).

*Cray car cháh tacha déi amiang ' I accidentally ate rice brother's '

6. (Par-) Nominalized-action prefix.

This prefix nominalizes the action of the verb and has the meaning 'the doing of something.' (Par-) occurs with almost all monosyllabic verb roots and with some disyllabic verbs. The allomorphs of (par-) are: (a) those which occur with monosyllabic verbs--par- (523), par- (82--all of which can also occur with par-), ta- (1) and -an- (3); (b) those which occur with disyllabic verbs—par- (15 — occur on disyllabic verbs with a-presyllable) and -r- (22). This -r- allomorph is infixed like the -r-allomorph of (tar-) (see i.2).

Examples of nominalized-action prefix with monosyllabic verbs:
- a ‘to say’
- âng ‘to roast’
- bîq ‘to lie down’

- par-a ‘the saying’
- par-âng ‘the roasting’
- parbîq ‘the lying-down’
bóy 'to salt'  parbóy 'the salting'
cat 'to burn (food)' parcat 'the burning'
hóm 'to bathe' parhóm 'the bathing'
keat 'to cut around' pa-/parkeat 'the cutting around'
piq 'to dig' parpiq 'the digging'
boan 'to pile up' ta-/pa-/parboan 'the piling up'
cloñ 'to play' callôñ 'the playing' (=parclôñ)
coiq 'to sharpen' canoïq 'the sharpening' (=parcoïq)
pôc 'to go' parpôc 'the going' (=parpôc)

Examples of nominalized action prefix with disyllabic verbs:
achâng 'to measure' rchâng 'the measuring'
achunj 'to instruct' rchunj 'the instructing'
angô 'to rest' parngô 'the resting'
arao 'to broadcast' parrao 'the broadcasting'
caléc 'to tickle' carlêc 'the tickling'
cavat 'to scratch' carvât 'the scratching'
pahoc 'to teach' parhôc 'the teaching'

7. (-an-) Nominalizer infix. ́

(-an-) occurs with a verb root and forms a noun which is the result of
the action, the instrument used in doing the action, or the location of
the action. These meanings may be determined by placing one of the following
words between the verb root and the noun formed: côh 'so, then' shows
that the noun is the result; dâng 'by, with' shows that the noun is the
instrument; and na 'direction, place' shows that the noun is the loca-
tion. For example:

— clanh côh callanh 'braid so braided-thing'
— cláq dâng calláq 'prop with a prop'
— pear na panear 'go-along-edge place path-along-edge'

(A few exceptions have been found which will not take the three
words above. Cha 'to eat' tâna 'food'; clâm 'to put whole piece of
food in mouth at once' callâm 'the whole piece').

(-an-) occurs with both monosyllabic (106) and disyllabic (42) verb
roots.

7 The result nouns are similar to Jacob's 'object made', instrument nouns are Jacob's 'utensil'.

MKS 2:15-30 (c)1966 See archives.sealang.net/mks/copyright.htm for terms of use.
The infix (-an-) has allomorphs -an- (32), -ann- (4), -al- (27), -ar- (16), -arn- (17), -n- (4), which occur with monosyllabic verb roots. The morphophonemic rules governing the occurrences of the allomorphs of (-an-) with monosyllabic verb are as follows:

(1) Verbs with initial cl take the -al- infix between the first and second consonant.

- clang 'to pipe (water)'
- clanh 'to braid'
- cláq 'to prop'
- cleang 'to bar door'
- clot 'to line something'
- callang 'a bamboo pipe'
- callanh 'something braided'
- calláq 'a prop'
- calleang 'a door bar'
- callot 'a lining'

(2) Verbs with initial cr and tr take -ar- between the first and second consonant.

- crang 'to carry between two'
- crong 'to surround'
- crúp 'to cover over'
- treang 'to bar door'
- carrang 'a carrying pole'
- carrong 'something surrounded'
- carrúp 'a cover'
- tarreang 'a door bar'

(3) Verbs with initial r take -n- or -r-.

- róq 'to pile brush'
- rúc 'to stir food inside bamboo section'
- röq 'to cook soup'
- rnóq 'the cleared field'
- rnúc 'stick used for stirring food inside bamboo'
- rröq 'soup'

(4) Verbs with initial t take -tn-.

- tayh 'to hammer'
- táp 'to push or point into'
- táq 'to work'
- tean 'to tie string around'
- tem 'to prepare betel quid'
- tóng 'to tie to'
- tarnaq 'the work'
- tarnaun 'that used to tie'
- tarnem 'betel quid'
- tarnõng 'that used to tie'

(5) Verbs with initial c, k, kh, and p take -an- or -ann-. There is no way of predicting which of the two allomorphs will occur.

- cáng 'to put across'
- cang 'to collar (pig)'
- canáng 'that which is put across'
- cannang 'collar for pig'
cay ‘to plow’
cál ‘to chop large trees’
cóh ‘to chop’
keit ‘to cut around’
khıar ‘to sweep yard’
pong ‘to bridge’
pöh ‘to divide’

*canay ‘plowed ground’
cannı́l ‘that which is chopped’
canöh ‘shopping block’
canır ‘pieces cut’
caniır ‘yard broom’
panong ‘a bridge’
pannöh ‘pieces’

(6) Initial ch becomes t when an allomorph of (-an-) is added to a
verb. (Ch never occurs presyllable initial in Pacöh except in reduplication).

cha ‘to eat’
chöh ‘to blacken teeth’
teč ‘that which is used to blacken

teeth’

tanna ‘food’
tıńı́h ‘a bundle’

(7) Other forms

pang ‘to cast net’
xat ‘to tie in bundle’
dyuat ‘to wipe’

*pinang ‘fish net’
nat ‘a bundle’
nuat ‘something used for wiping’

The allomorphs of -an- which occur with disyllabic (42) verbs are : -r- (31), -n- (3), -l- (2), and -m- (2).

(1) -r- is the most common allomorph occurring with disyllabic
verbs in varied environments.

cachang ‘to laugh’
cahöq ‘to cough’
caxang ‘to make a sound’
tahau ‘to give medicine’
tangırh ‘to breathe’
tapong ‘to contain’
ticu ‘to sit’
culal ‘to turn eyes up’

*charchang ‘laughter’
carhöq ‘a cough’
carxang ‘a sound’
тархау ‘medicine’
təngırh ‘breath’
tarpöng ‘container’
tərcu ‘chair’
cərlal ‘protruding eyes’

Exceptions to the above occur with the following allomorphs:

(a) -n- occurs before main-syllable t and sometimes ch

chacic ‘to comb hair’
canbic ‘a comb’
catıp ‘to cover over’
cantıp ‘a lid’
attır ‘to put on basket straps’
ntır ‘basket straps’
VERBAL AFFIXATION IN PĀCŌH

(3) -l- occurs before main-syllable l.

palai ‘to give remedy’  
pallai ‘medicinal remedy’

palô ‘to kindle flame’  
pallô ‘a flame’

(4) -m- occurs before main-syllable p.

apuâng ‘to roof; put on hat’  
mpuâng ‘roof or hat’

apuâng ‘to roof; put on hat’  
mpuâng ‘roof or hat’

(5) Other forms which occur with disyllabic verbs.

rungâyh ‘to think’  
pârngâyh ‘thought’

rungîh ‘to think’  
pârngîh ‘thought’

tidol ‘to cross log bridge’  
pârdol ‘log bridge’

ti-ôq ‘to vomit’  
tang-ôq ‘that which is vomited’

8. Continuative reduplicated prefix.

Some (203) monosyllabic verbs with initial consonants can take the continuative reduplicated prefix. A reduplicated verb is general in meaning and cannot take an object (e.g. cur chicha ‘I eat’ ). A simple verb is specific and can take an object (e.g. Cur cha dôi I eat rice). A reduplicated verb can occur alone in the predicate slot or as a second verb (e.g. cur chicha ‘I eat’; cur pôc chicha ‘I go eat’).

The reduplicated prefix is formed by a reduplication of the first consonant and either a or i. There is no apparent phonological basis for the use of either a or i before certain verbs. Sometimes both would be acceptable.

Some examples of reduplication:

bal ‘to illuminate’  
bibal

cha ‘to eat’  
chicha

câl ‘to clear field’  
kicâl

crông ‘to surround’  
cacrông

doq ‘to place’  
dadôq

pôc ‘to go’  
papôc

pi ‘to talk’  
papi

8 This resembles Jacob’s ‘frequentative’. 
9. (ca-) Completive prefix. 9

(Ca-) (15) has the meaning of completing an action or of doing something thoroughly. At first glance, one might suspect this prefix to be the same as the reduplicative prefix (8.) because the ca- prefix occurs almost entirely on verbs which begin with c, k, or kh. However, the completive prefix ca- differs from the continuative reduplicative prefix in the following ways:

(1) Reduplicative prefixed verbs cannot take objects. Completive prefixed verbs can take objects.

(2) There is an overlap with some of the verbs in that both completive and reduplicative can occur and the informant says that the two are different.

It is interesting to note that this completive prefix ca- also occurs in the number system of Pacôh (e.g. bar ‘two’, cabar ‘both’; pe ‘three’ epe ‘all three’, poan ‘four’, capoan ‘all four’.)

The verbs which have been found to occur with ca- ‘completive prefix are:

clôt ‘to break up (dirt)’
cluah ‘to break out bamboo section’
coaih ‘to shave wood’
coanh ‘to braid’
coah ‘to shave wood’
coar ‘to grate’
côt ‘to bend double’
cuah ‘to saw’
keac ‘to chop head of chicken’
keat ‘to cut around’
kênh ‘to break with teeth’
khô ‘to roast fish’
lûm ‘to cover completely’
caclôt ‘to thoroughly break up’
cacluah ‘to completely break out bamboo section’
cacoaih ‘to completely shave wood’
cacoanh ‘to braid completely’
cacoah ‘to shave wood completely’
cacoar ‘to grate completely’
cacôt ‘to bend completely double’
cacuah ‘to saw completely’
cakeac ‘to completely chop off head of chicken’
cakeit ‘to cut completely around’
cakênh ‘to break completely’
cakhô ‘to roast completely’
calûm ‘to cover completely’

9 This resembles Jacob’s ‘intensifier’,
10. (N-) Pretence prefix.

This is a nasal prefix having conditioned allomorphs which assimilate to the point of articulation of the initial consonant of the main syllable. This prefix means ‘to pretend or appear to do something’. (N-) can occur only on monosyllabic verb roots. The prefixed verb cannot stand alone in the verb slot but must be preceded by the verb tág ‘to do, make, work’. The prefixed verb must be followed by the unaffixed verb root in a reduplicative manner.

\[
\begin{align*}
\text{bid} & \ ' \text{to lie down & sleep}' & \text{tág mbiq biq} & \ ' \text{to pretend to sleep}' \\
\text{tág} & \ ' \text{to do, work}' & \text{tág ntág tág} & \ ' \text{to pretend to work}' \\
\text{chom} & \ ' \text{to know}' & \text{tág nchom chom} & \ ' \text{to pretend to know}'
\end{align*}
\]

Although the ‘pretence prefix’ does not occur with disyllabic verbs the same idea may be expressed in the following way:

\[
\begin{align*}
\text{a- ay} & \ ' \text{to be sick}' & \text{tág a- ay ay} & \ ' \text{to pretend to be sick}' \\
\text{cacháng} & \ ' \text{to laugh}' & \text{tág cacháng cháng} & \ ' \text{to pretend to laugh}'
\end{align*}
\]

Here the verb is unchanged but there is a reduplication of the main syllable.

11. (Pi-) Causative prefix occurring with non-verb roots.

(Pi-) ‘causative’ prefix occurs with modifiers\(^10\) and a few nouns to form causative verbs. (Pi-) has unconditioned allomorphs pi- (60), pa (8), ta- (5) and a- (1). (Pi- can occur with three of the same verbs that pa-do and with two of the verbs that ta- does).

(Pi-) has only been found with monosyllabic roots. It is not possible to predict which modifiers and nouns can occur with the causative prefix.

Only three nouns have been found to occur with the causative prefix:

\[
\begin{align*}
\text{nöh} & \ ' \text{a name}' & \text{a/-panöh} & \ ' \text{to name}' \\
\text{put} & \ ' \text{stack of brush}' & \text{piput} & \ ' \text{to stack brush}' \\
\text{pet} & \ ' \text{wax}' & \text{pipët} & \ ' \text{to fill cracks with wax}'
\end{align*}
\]

\(^10\) The distinction between modifiers and verbs in Pacöh is still not clear at this stage of analysis. If these modifiers do fall into the category of verbs, they must, at least be considered as one class of verbs which take the (pi) prefix to form the causative.
Some of the modifiers which can occur with causative prefix are:

<table>
<thead>
<tr>
<th>English</th>
<th>Hawaiian</th>
</tr>
</thead>
<tbody>
<tr>
<td>swollen</td>
<td>pi-ayh 'to make swollen'</td>
</tr>
<tr>
<td>enough</td>
<td>picürp 'to make enough'</td>
